

ABS QuattroRoll

Glider with 4 ball bearing-mounted rollers for traversable lifeline systems

ABS QuattroRoll is the name of our best-ever roller glider for horizontal **lifeline systems**. It glides perfectly around every curve and runs smoothly over every intermediate support on its four ball-bearing rollers, whereby it remains firmly attached to the steel cable - the closing mechanism, which can only be operated using both hands, prevents it from being accidentally or unintentionally opened. Thanks to its large anchorage eyelet, this roller glider can be used with a whole range of different carabiners.

The robust design of our roller glider is a combination of weather-resistant plastic, high-quality aluminium and stainless steel (V4A). This means that our ABS QuattroRoll is not only suitable for use outdoors but fulfils all the prerequisites for a long service life.

Application

Facade/ Wall

Certification
